

Recently Zebra mussels were found in Roosevelt Lake and because Crooked Creek flows out of Roosevelt to Pug Hole Lake and then to Mitchell Lake and the outlet from Mitchell Lake is Daggett Brook which flows into Eagle Lake so the DNR has posted signs at the Mitchell and Eagle Lake public accesses. They are doing this because the zebra mussel veligers float in the water and could cause infestations in lakes downstream.

Mitchell Lake Sign

Eagle Lake Sign

No adult mussels have been found and the DNR plans to do a search this fall and next spring looking for adult zebra mussels.

What you can do to help is check your docks and lifts as you take them out this fall looking for adult zebra mussels attached. If you find adult mussels please scrape a couple off put them in a zip lock bag with a little water and call the DNR AIS contact Camden Droppo, see contact information below.

Also please send email to flpoamn@gmail.com with location so we are aware that adult mussels were found.
